**WHICH IS THE BEST MEMORY ONE  
STRATEGY?**

**ARE THERE LIMITATIONS TO MEMORY ONE  
STRATEGIES?**

**WHICH IS THE BEST MEMORY ONE  
STRATEGY?**

**ARE THERE LIMITATIONS TO MEMORY ONE  
STRATEGIES?**

$$p = (p_1, p_2, p_3, p_4) \in \mathbb{R}_{[0,1]}^4$$

$$\begin{bmatrix} p_1 q_1 & p_1 (-q_1 + 1) & q_1 (-p_1 + 1) & (-p_1 + 1) (-q_1 + 1) \\ p_2 q_3 & p_2 (-q_3 + 1) & q_3 (-p_2 + 1) & (-p_2 + 1) (-q_3 + 1) \\ p_3 q_2 & p_3 (-q_2 + 1) & q_2 (-p_3 + 1) & (-p_3 + 1) (-q_2 + 1) \\ p_4 q_4 & p_4 (-q_4 + 1) & q_4 (-p_4 + 1) & (-p_4 + 1) (-q_4 + 1) \end{bmatrix}$$

$$\max_p u_q(p) \text{ such that } p \in \mathbb{R}_{[0,1]}^4$$

## Lemma

$$u_q(p) = \frac{\frac{1}{2}pQp^T + c^T p + a}{\frac{1}{2}p\bar{Q}p^T + \bar{c}^T p + \bar{a}}$$

- ▶  $Q, \bar{Q} \in \mathbb{R}^{4 \times 4}$
- ▶  $c, \bar{c} \in \mathbb{R}^{4 \times 1}$
- ▶  $a, \bar{a} \in \mathbb{R}$

## PURELY RANDOM

$$p = (p, p, p, p)$$

$$S_q = U_{i=1}^{2N} \lambda_i \cup \{0, 1\}$$

$$1 \leq |S_{q(i)}| \leq 2N + 2$$

$$S_q = \bigcup_{i=1}^{2N} \lambda_i \cup \{0, 1\}$$

$$1 \leq |S_{q(i)}| \leq 2N + 2$$

**Result: optimal behaviour using eigenvalues of companion matrix**

REACTIVE

$$p = (p_1, p_2, p_1, p_2)$$

**Result: optimal behaviour using Sylvester's resultant  
(Sylvester 1840)**

Contributor

## Brief description

Adds a new file `multivariate_resultants` that contains two classes.  
These classes are implementations of the following multivariate resultants:

- Dixons
- Macaulay

They are a natural follow up from the resultants implemented withing the library:

- `subresultants_qq_zz.py`

Resultants are used to identify if polynomials have common roots. The multivariate version is for multivariate systems.

## Other comments

Tests have been implemented and are currently passing. I added relevant literature and some notebooks with examples in the `example/notebooks/` directory.
